CONNECTED BALL TECHNOLOGY FOR THE FIFA WORLD CUP 2026™

Trionda carries the latest evolution of adidas Connected Ball Technology in the form of an innovative new side mounted chip system.

The inertial measurement unit (IMU) motion sensor chip now sits inside a specially created layer in one of the four panels and sends precise ball data to the VAR system in real time.

adidas Connected Ball Technology helps video match officials (VMOs) make faster offside decisions, while also aiding VMOs in identifying each individual touch of the ball, resulting in less time spent resolving specific incidents, i.e. possible handball.
